

Critical Incidents In Nursing Management

The aim of this assignment is to reflect back on a critical incident that happened either on placement. The incident will include an ethical issue with an elderly lady who has dementia and refused to take her medication while under our care. The student will discuss over the situation arose and why there was a need to cover her medication and will look at how and ethical issues surrounding senior medication. Learning contract and mental capacity which are in place to protect patients will also be looked at. A model of reflection will be used to reflect back on the incident. Looking at each of the stages of Gibbs model of reflection to help breakdown the incident. Ethical theories and principles and how they influence decision making in nursing will be discussed and related to the patient. For the purpose of this assignment and to comply with the NMC, (the code 2004) an confidentiality my patient will be used Mrs M.

Nurses are required to work within the law and according to the requirements of the NMC the code. These rules and legal obligations are set out for nurses and midwives who have a legal and professional duty to care for patients when under their care and are accountable for their actions. This is to protect patients as they are not limited by your acts or omissions (Griffin & Thompson 2008). Forrester (2008) states that law is a system of principles and rules of human conduct prescribed by society and enforced by public authority. Bala (2008) states for a law to be effective it should have sanctions for punishing those who fail to adhere to its stipulations. Laws are developed in response to the needs of society and the survival of the law depends on customary usage.

With the Human Rights Act in force, Patients Association and other informative organisations, patients and families are becoming more aware of their rights and are more open to challenging healthcare decisions such as end of life issues or do not attempt resuscitation orders (DNAR). Nurses need to understand the law and to make sure they are making the right decisions for their patients. The NMC the code (2004) states that "As a professional, you are personally accountable for actions and omissions in your practice and must always be able to justify your decisions".

Having an excessive daily nurse workload increases the risk of patient safety incidents and deaths, according to a ground-breaking study from Finland. Moral distress in the healthcare environment is a phenomenon that's been broadly discussed and partially attributed to compromised practice standards.
