Lamina

PRODUCT NOTE

Multilabel Slide Scanner

Key Features

- High-throughput whole-slide scanner for pathology research
- High-speed multimodal imaging and analysis of FFPE tissue sections and TMA's
- Autofluorescence Reduction Technology (ART) for clearer visualization of protein expression
- Exquisitely sharp H&E, IHC and immunofluorescence images
- Exclusive technology and award-winning design

A Clearer Vision of Pathology

Introduction

PerkinElmer's Lamina™ multilabel slide scanner delivers clear, high-resolution images from whole slides and Tissue Microarrays (TMAs). With brightfield, fluorescence and Autofluorescence Reduction modes all in one instrument, Lamina is a flexible platform for your research pathology lab.

Lamina addresses your everyday H&E imaging needs as well as immunohistochemistry (IHC) and immunofluorescence. With the option of selecting our new proprietary Autofluorescence Reduction Technology (ART™) and crosstalk correction between fluorophores, it produces exceptional results to enable clearer visualization of protein expression in formalin-fixed, paraffin-embedded (FFPE) tissues.

The Lamina multilabel slide scanner is configured to meet the varied needs of a larger research facility. With multiple imaging modes in one instrument, high-speed imaging technology and up to a 250-slide capacity, it offers the flexibility to support your current and future applications while maximizing your productivity.

The system includes two copies of PerkinElmer's inForm® Tissue Finder™ software for offline analysis and can also be configured with a fully integrated pathology data management and telepathology solution.

Lamina extends PerkinElmer's range of quantitative pathology solutions for translational research and is designed to support pathologists to deliver better, faster, more accurate results enabling the development of personalized therapies and improving human health.
